# 1 Product definition

The TouchController device (abbreviated as 'TC') is an operator panel based on the Linux Yocto operating system and Codesys runtime, used for both the management of PLC logics and related communication protocols, and for the graphical interface, exploiting native TargetVisu and WebVisu technologies.

In the specifications we will adopt the following terms as terminology:

- **EndUser**: the user who will interact with the configured device.
- **SetupUser**: the user who will be able to access the configuration GUI and customize the device parameters.
- **PixsysLauncher**: the program that manages the device startup phase.
- **WPControl**: GUI for device configuration.

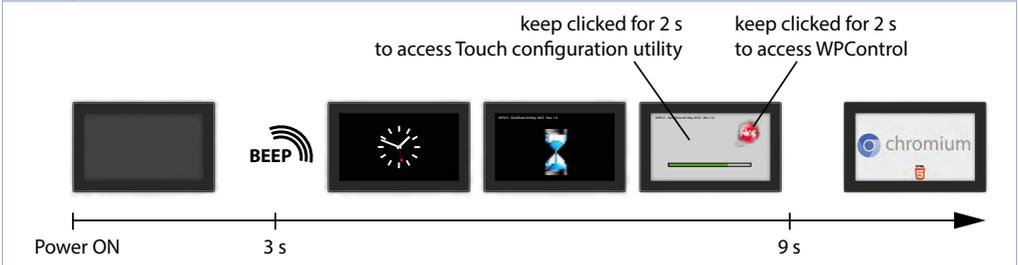

## Default WPControl SetupUser's credentials

Username	user
Password	123456

**NB** It is recommended, for obvious security reasons, to set a new personal password. **We accept no liability for the use of default passwords.**

# 2 Working logic

## Boot sequence

There are no buttons to turn on the device, it always starts automatically when power is connected and shuts down immediately when power is removed.

Three seconds after the device is powered, user will hear a short power-up beep and then a static clock image appears on the screen followed by another hourglass image with a text string, on top left, containing the type of product and the identification data of the operating system version (ex: *TC815-A-P2 - BuildDate 04 May 2023 - Rev 1.0*). This hourglass image can be replaced by the user using the appropriate procedure (see section 3.2.a).

As soon as this boot phase is complete the system starts a PixsysLauncher program.

PixsysLauncher is the program which manages the operating modes of the device.

When starting, the program shows for 2 seconds a red circle with the wording STOP at the top right.

At this stage, the user can:

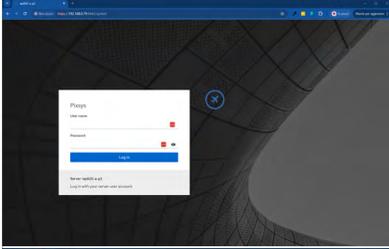

- access the WPControl configuration interface (see section 3) by pressing and holding the STOP button for at least 2 seconds
- start the touch calibration procedure (see section 3.2.f) by pressing and holding any area other than the STOP button for at least 2 seconds
- do not press in any area of the screen to let the panel start normally.

## 3 WPcontrol

### 3.1 System users

SetupUser configures the panel in normal function.

In case of remote access (FTP, SSH etc...) SetupUser can operate on file changed by WPControl.

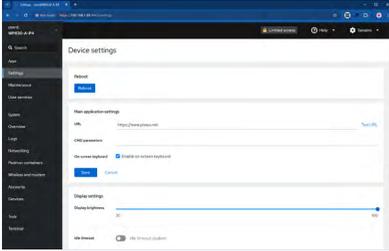

When opening the configuration's interface, a login request is displayed: logging in, SetupUser is allowed to customize some aspects of the product.

The default login credentials are:

Username : user

Password : 123456

The screen prompted after logging in is shown here: it shows a menu on the left-hand side and a series of information panels in the middle.

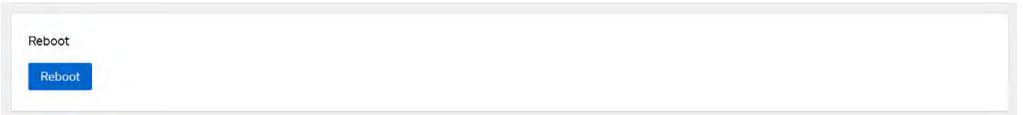

Each item in the menu on the left is described below.

## 3.2 Apps section

### 3.2.1 Settings

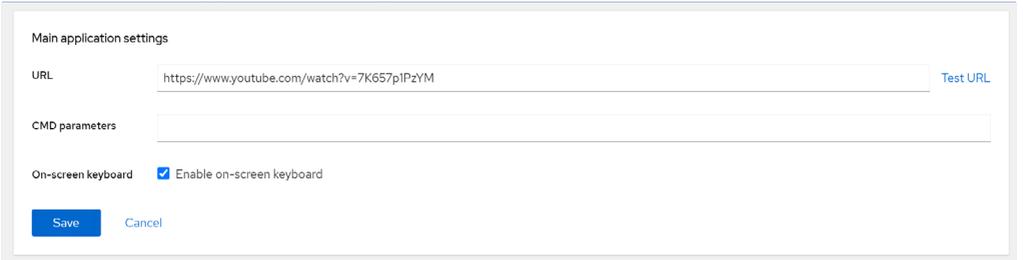

The parameters that user can configure in the Apps section are as follows:

#### 3.2.1.a Reboot

The "Reboot" button allows a controlled restart of the device without having to switch the power supply off and on again.

#### 3.2.1.b Main Application Settings

In the "Main Application Settings" section, there is a text field in which the URL that will be opened by the browser in EndUser mode must be entered.

The appearing "Test URL" button, allows you to validate the URL before saving it (validation is done by opening the browser window in the foreground).

In the event that the web browser has crashed (i.e. the process has exited), it must be restarted (by

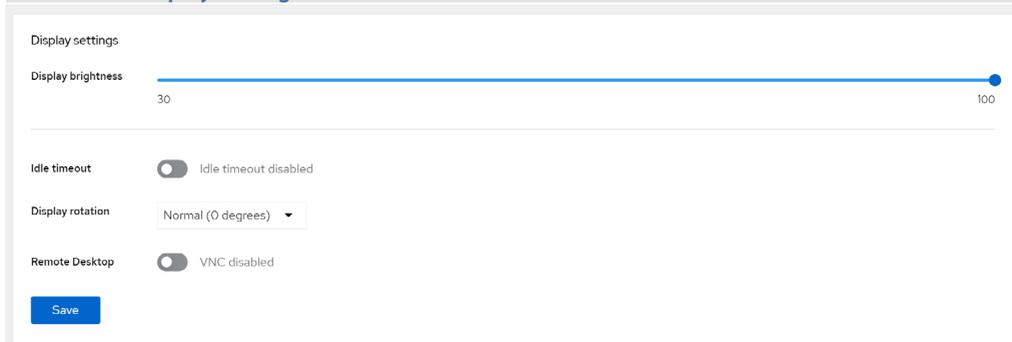

system).

The “*CMD parameters*” field allows you to add specific browser start-up parameters. It is recommended not to modify this field unless strictly necessary.

The “*Enable on-screen keyboard*” selection enables/disables the opening of a virtual on-screen keyboard during the use of the browser by the end user, a keyboard that is automatically opened when a text type field is selected.

When the settings are complete, press the Save button to save them.

### 3.2.1.c Display settings

Display settings

Display brightness 30 100

Idle timeout  Idle timeout disabled

Display rotation Normal (0 degrees)

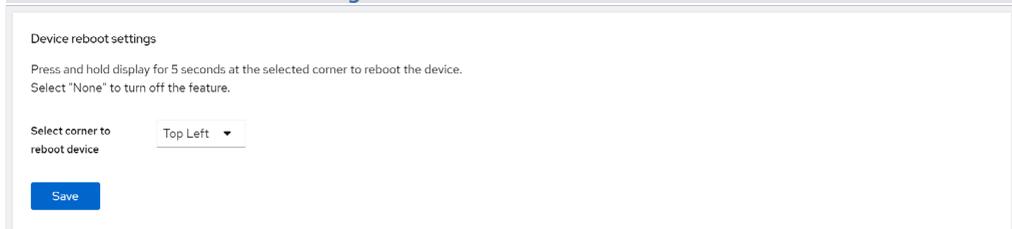

Remote Desktop  VNC disabled

Save

In this section it is possible to adjust the brightness of the display (default: 100 per cent), the activation/deactivation of the screen saver function (default: 3600 seconds), the rotation of the screen and the enabling/disabling of the VNC server function on the device (default: disabled).

When the settings are complete, press the Save button to save them.

### 3.2.1.d Device reboot settings

Device reboot settings

Press and hold display for 5 seconds at the selected corner to reboot the device.  
Select “None” to turn off the feature.

Select corner to reboot device Top Left

Save

The panel has a restart function that can be called up by holding down a specific area of the screen for at least 5 seconds (default: upper left corner).

This section allows you to define the position of the point on the screen to be held down or to deactivate the function.

When the settings are complete, press the Save button to save them.

### 3.2.1.e Touch calibration

Touch Calibration

Start calibration

The “*Start calibration*” button starts the panel touch area calibration procedure: follow the on-screen instructions.

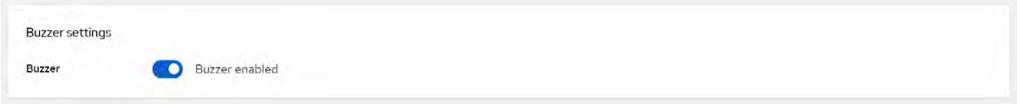

The procedure guides the user through a few steps to define the touch-sensitive screen area.

The user simply has to press and release one after the other the crosses that appear in different areas of the screen.

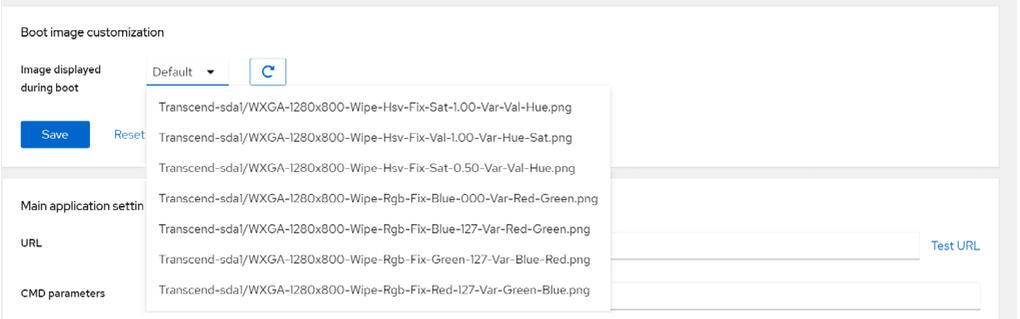

At the end of the sequence, a message informs about the success or failure of the procedure.

### 3.2.1.f Buzzer setting

The “*Buzzer settings*” section allows you to activate/deactivate the buzzer sound at the touch press event.

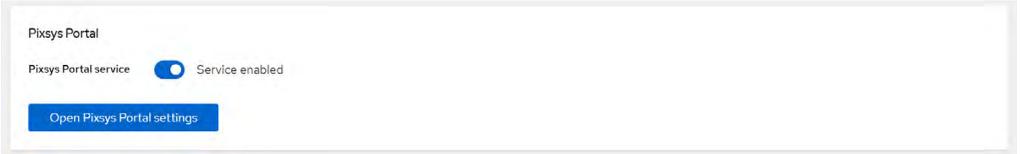

### 3.2.1.g Boot image customization

By inserting a USB key, this section lists the files in .png format present on the key. Images can be selected here to become the background image of the device’s start-up screen: the user can then customise the device’s start-up screen.

When the settings are complete, press the Save button to save them.

### 3.2.1.h PixsysPortal

In the “*Pixsys Portal*” section you can enable the VPN access service provided by Pixsys.

The additional licence code 2400.38.002 is required to use the service.

Once the service has been enabled, it will be possible to access the relevant configuration page via the “*Open Pixsys Portal settings*” button or, from a PC connected to the same network as the panel, by accessing from the Web Browser at `https://panel address*:8080`.

## 3.2.1.i System information

System information	
Device model	WP820-A-P2
Serial number	P062400000232400001
Distribution name	Pixsys OS
Firmware version	1.4.0
Kernel version	6.0.2
Architecture	aaarch64

The “*System information*” section summarises the machine’s system data, which is useful if technical assistance is required.

## 3.2.2 Maintenance

### 3.2.2.a Configuration backup

Configuration backup

**Prepare USB drive**

The USB drive should be formatted to include only one FAT32 partition.

**Backing up WebPanel configuration**

1. Plug in USB drive to a USB port of the device.
2. Press “Export configuration” button.
3. Current configuration will be saved to a USB drive.

[Export configuration](#) [Export licenses](#) [Export user data](#)

**Restoring WebPanel configuration**

1. Plug in USB drive to a USB port of the device.
2. Press “Restore configuration” button.
3. WebPanel configuration will be restored from a USB drive.

[Restore configuration](#) [Restore licenses](#) [Restore user data](#)

⚠ Warning: This will override current configuration!

The “*Configuration Backup*” section allows alternative backup and restore to/from USB drives of device configuration, installed licences and user data. The backup can be used to restore or even quickly duplicate a machine once it has been configured.

The steps to follow are described on screen.

Restoration operations overwrite information already present on the device, so please be careful.

### 3.2.2.b Firmware update

Firmware update

1. Write firmware update image to a USB drive.
2. Plug in USB drive to a USB port of the device.
3. Press “Update firmware” button and confirm.
4. The device will reboot and start the update procedure.

[Update](#)

The “*Firmware update*” section allows the device firmware update procedure to be started after inserting the USB memory containing the update into the appropriate port.

For more information on the update procedure, please contact Pixsys technical support by writing to support@pixsys.net

### 3.2.2.c Factory reset

#### Factory reset

1. Select the "Reset" option and confirm the action.
2. The device will power down and commence the reset process.

Reset

⚠ Warning: Factory reset will erase all user data and restore default settings!

In this panel, the user has the option of restoring the device to factory settings by pressing the button in the appropriate section. This operation deletes and overwrites all information already on the device and returns it to its factory condition.

When the device restarts automatically, the touch calibration procedure will start (for more information on this procedure see section 3.2.f).

**NB:** If there is user data / Codesys projects / PixsysPortal licences in the panel that you do not wish to lose, please make the necessary backups as described in "3.2.2.a Configuration backup".

### 3.2.2.d Reboot

#### Reboot

Reboot

The "Reboot" button allows a controlled restart of the device without having to switch the power supply off and on again.

### 3.2.2.e System information

#### System information

Device model	WP820-A IP2
Serial number	P062400000232400001
Distribution name	Pixsys OS
Firmware version	1.4.0
Kernel version	6.0.2
Architecture	aaarch64

The "System information" section summarises the machine's system data, which is useful if technical assistance is required.

## 3.2.3 User services

### User services

User services status

Add new service

No services

By clicking the "Add new service" button, it is possible to configure the execution, at operating system start-up, of services created by the user, indicating their path under "Service name" and any start-up parameters under "Command line". The "User services status" button allows the status of any previously configured services to be queried and displayed.

## Add new systemd service ✕

*Enter a service name and a command to execute.  
Service will be automatically enabled and started.  
Service name can contain alphanumeric characters, dashes and  
underscores.*

Service name \*

Command line \*

Add

Cancel

# 3.3 System section

## 3.3.1 Overview

Web console is running in limited access mode. [Turn on administrative access.](#)

WP630-A-P4 (wp630-a-p4) running Pixsys OS 1.8.0

### Health

⚠️ 1 failed login attempt  
Jun 10, 05:22 PM from ::ffff:192.168.1.198 on web console  
Last successful login: Jun 10, 05:22 PM  
[View login history](#)

### Usage

CPU  1% of 8 CPUs  
Memory  0.88 / 3.8 GiB  
[View metrics and history](#)

### System information

Machine ID 4c16076a336644eab40837f4e0ba44d5  
Uptime 12 days  
[View hardware details](#)

### Configuration

Hostname WP630-A-P4 (wp630-a-p4) [edit](#)  
System time [Jun 11, 2025, 9:36 AM](#) ⓘ  
Domain [Join domain](#)  
Performance profile none  
Secure shell keys [Show fingerprints](#)

The Overview section allows you to see general information about the system status, such as power-on time (“Uptime” value), CPU load and RAM memory (“Usage” section), clock and product name (“Configuration” section).

### Change system time

Time zone

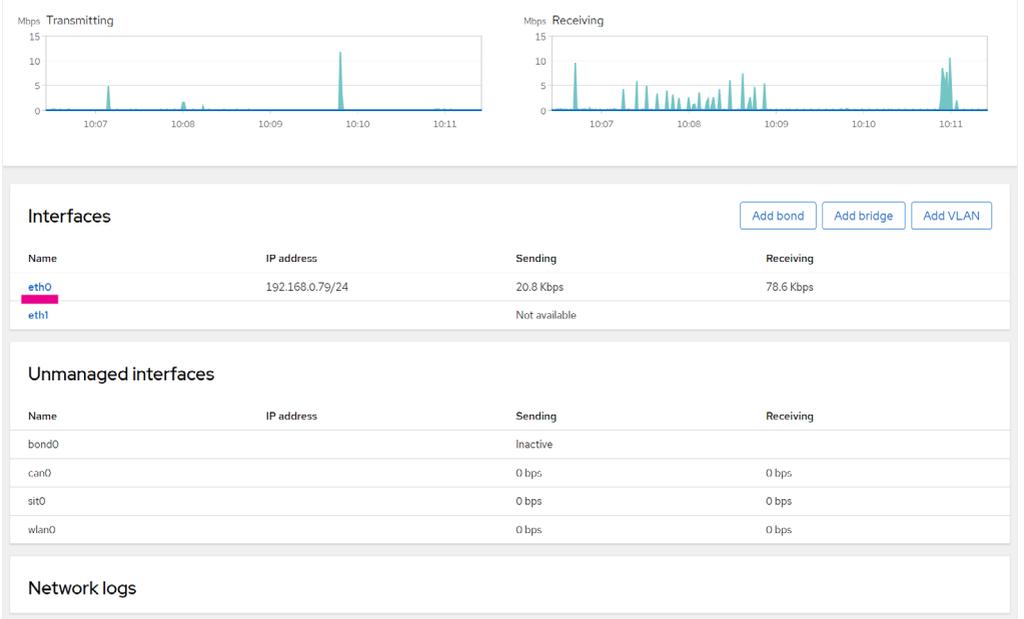

Set time

[Change](#) [Cancel](#)

- Manually
- Automatically using NTP
- Automatically using specific NTP servers

By pressing the “System time” field, it is possible to configure the system clock either manually or automatically from the NTP server (Google) or automatically from a specific server by indicating its IP address.

## 3.3.2 Networking

The dashboard displays two line graphs at the top: 'Transmitting' and 'Receiving' data rates in Mbps. The 'Transmitting' graph shows a peak of approximately 12 Mbps around 10:10. The 'Receiving' graph shows a peak of approximately 12 Mbps around 10:11. Below the graphs is a table of network interfaces.

Name	IP address	Sending	Receiving
eth0	192.168.0.79/24	20.8 Kbps	78.6 Kbps
eth1		Not available	

Buttons for 'Add bond', 'Add bridge', and 'Add VLAN' are located in the top right corner of the interface section.

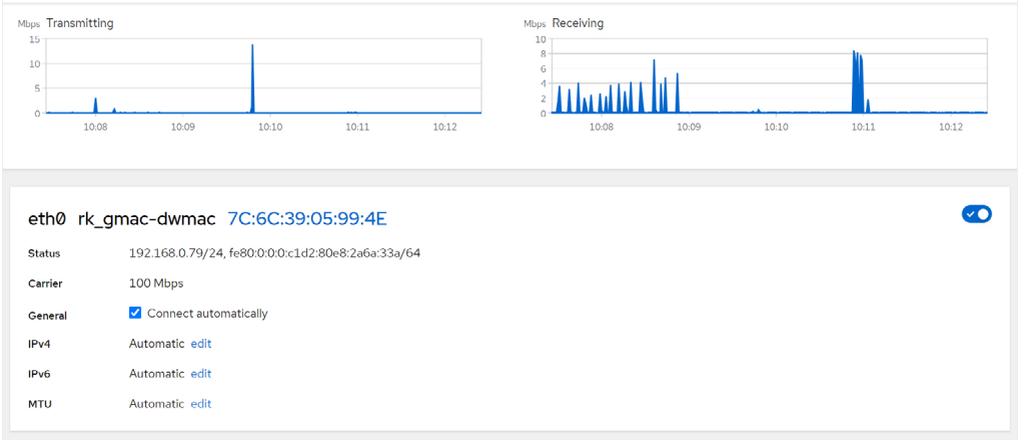

Below the interface table is a section for 'Unmanaged interfaces' with the following data:

Name	IP address	Sending	Receiving
bond0		Inactive	
can0		0 bps	0 bps
sit0		0 bps	0 bps
wlan0		0 bps	0 bps

At the bottom of this section is a 'Network logs' heading.

The “Networking” menu item shows real-time information about the active connection and, by clicking on the network card name, allows you to go and configure the connection parameters.

Networking > eth0

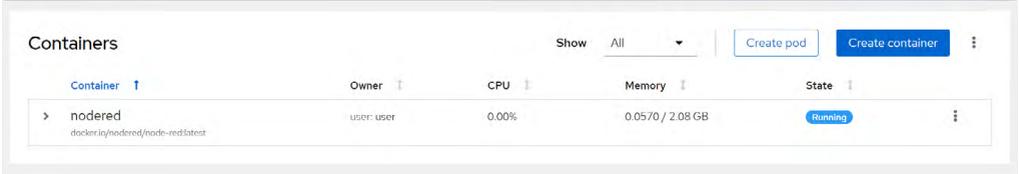

The configuration page for eth0 shows the following details:

- eth0 rk\_gmac-dwmac 7C:6C:39:05:99:4E** (with a toggle switch)
- Status:** 192.168.0.79/24, fe80:0:0:c1d2:80e8:2a6a:33a/64
- Carrier:** 100 Mbps
- General:**  Connect automatically
- IPv4:** Automatic [edit](#)
- IPv6:** Automatic [edit](#)
- MTU:** Automatic [edit](#)

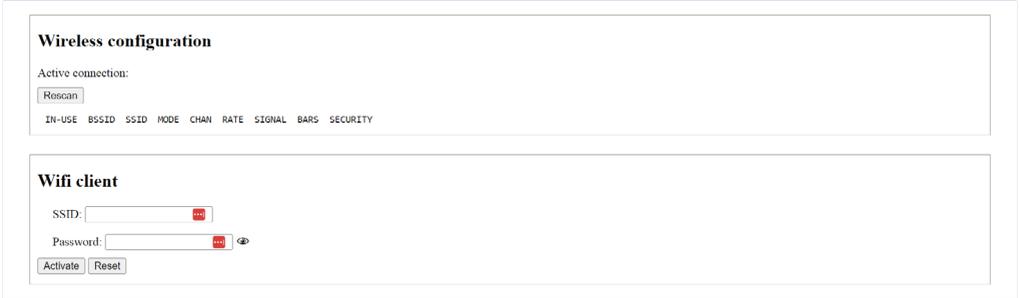

In the screen that opens, the user can check the connection status, enabling and disabling the network card, and can read and configure the system’s IP and how to assign it.

### 3.3.3 Podman containers

The “Podman Containers” menu item enables the monitoring and management of containers in the Docker environment. For the creation of a container, see specific documentation on the Pixsys site.

### 3.3.4 Wireless and modem

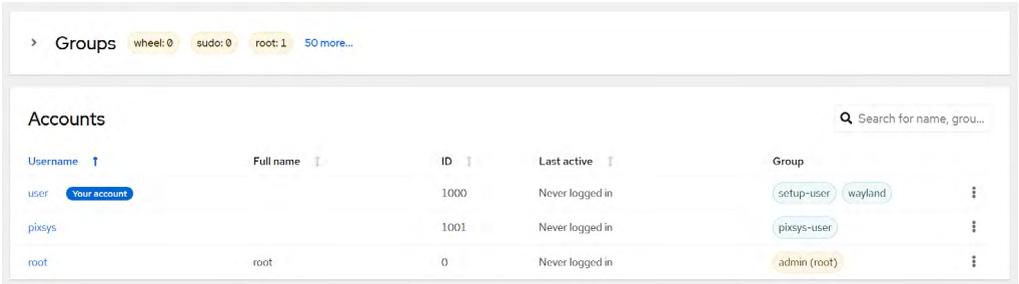

The “Wireless configuration” section, by pressing the “Rescan” button, shows the available WiFi networks and the parameters (SSID and Password) to be entered to connect to the selected WiFi network. The “Wifi client” section allows you to configure the device to act as a hotspot and then indicate the password to be provided in order to connect.

The device can be equipped with a USB-Wifi pen (Pixsys code 2400.10.021) that allows connection to 802.11 abgn/ac wireless networks.

**NB:** the use of USB-Wifi pens not supplied by Pixsys does not guarantee that wireless connectivity will work and that it will be secure.

### 3.3.5 Accounts

The “Accounts” menu item allows authorised users to manage the structuring of groups and users and their authorisations.

# 3.4 Tools section

## 3.4.1 Codsys

### 3.4.1.a Runtime management

#### Runtime Management

Codesys PLC Logic behavior at boot

Codesys PLC Logic behavior at runtime

Management

The *“Runtime Management”* section allows control of the Codsys runtime installed in the device.

- Codesys PLC Logic behaviour at boot: the START/STOP choices allow you to choose whether the Codesys runtime should be started automatically or not at device start-up (default: START).
- Codesys PLC Logic behaviour at runtime: the START/STOP choices allow you to choose whether the Codesys runtime should be started automatically or not at device start-up (default: START).
- Management: *“DEVICE DISCOVERY”* allows the panel to beep a few times at brightness changes for easy identification within a multi-device installation. *“DISABLE BOOT APPLICATION”* prevents the BOOT application (project) from being loaded at Codesys runtime start-up, allowing connection to the device via the development environment in case of blocking exceptions triggered by the downloaded code. *“FULL PLC CODE ERASE”* completely deletes the project and related files from the device.

### 3.4.1.b Runtime status

#### Runtime Status

success

```

```

The *“Runtime Status”* section, via the *“READ STATUS”* button, checks the status of the Codesys Control service. *“active”* identifies that the service is running regularly.

In case the status is different from *“active”* it is recommended to contact Pixsys technical support.

### 3.4.1.c Backup password

#### Backup password

Create a password to encrypt your backup.

With the password enabled only protected backups can be extracted to the PLC.

To delete the password, delete the password field and press save.

**Attention!** If the password is deleted, the backups can no longer be restored.

Encrypt backups with password:  Ⓢ

This section allows a password to be applied when creating the backup. Thus, in order to extract such a backup to a new device, it must have the correct password (which must be entered in the same field).

### 3.4.1.d Backup to/from USB device

#### Backup to/from USB device.

If there isn't FAT32 USB device connected to the PLC the backup will be generated ore restored from /tmp

BACKUP CREATE

BACKUP RESTORE

This section allows you to create or retrieve a backup of a Codesys project present in the device, in order to install it in new devices, speeding up the mass production of machines.

**NB:** If a USB stick is not connected to the device, the archive containing the backup will be created in the "/tmp" directory, easily accessible via FTP.

### 3.4.1.e Create a debug log on USB Key

#### Create a debug log on USB Key

Creation of a log file to provide to technical support for assistance.

1. Connect a FAT32 formatted USB stick to the PLC.
2. Press the **CREATE LOG** button.
3. Wait for the "success" message to appear.
4. Remove the USB stick from the PLC.
5. Send the file with the .tar.7z extension present inside the flash drive to technical support.

This feature allows you to create an archive containing all the logs of the services running in the device (including the Codesys runtime), useful for sending to Pixsys Technical Support in case assistance is required.

## 3.4.2 Terminal

From this window, an SSH session can be accessed to manually invoke system commands.

# 1 Defnizioni

Il dispositivo TouchController (in breve "TC") è un pannello operatore basato su sistema operativo Linux Yocto e runtime Codesys, utilizzato sia per la gestione delle logiche PLC e dei relativi protocolli di comunicazione che per l'interfaccia grafica, sfruttando le tecnologie native TargetVisu e WebVisu. Nelle specifiche adotteremo come terminologia i seguenti termini:

- **EndUser:** l'utente che interagirà con il dispositivo configurato.
- **SetupUser:** l'utente che potrà accedere alla GUI di configurazione e personalizzare i parametri del dispositivo.
- **PixsysLauncher:** il programma che gestisce la fase di avvio del dispositivo.
- **WPControl:** GUI per la configurazione del dispositivo.

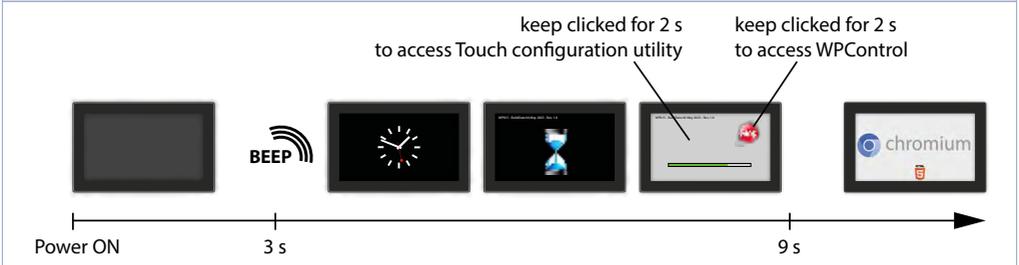

## Default WPControl SetupUser's credentials

Username	user
Password	123456

**NB** Si raccomanda, per evidenti motivi di sicurezza, di provvedere a impostare una nuova password personale. **Si declina ogni responsabilità per l'utilizzo delle password di default.**

# 2 Logica di funzionamento

## Boot sequence

Non ci sono pulsanti per accendere il dispositivo, che si avvia sempre automaticamente quando viene collegato all'alimentazione e si spegne immediatamente quando viene tolta l'alimentazione.

Tre secondi dopo l'accensione del dispositivo, l'utente sentirà un breve bip di accensione e poi sullo schermo apparirà un'immagine statica di un orologio. Successivamente apparirà un'altra immagine statica a clessidra con una stringa di testo, in alto a sinistra, contenente il tipo di prodotto seguito dai dati identificativi della versione del sistema operativo (es: *TC815-A-P2 - BuildDate 04 May 2023 - Rev 1.0*). Questa immagine a clessidra potrà essere sostituita dall'utente tramite apposita procedura (vedere il paragrafo 3.2.a)

Al termine di questa fase di avvio, il sistema avvia il programma PixsysLauncher.

PixsysLauncher è il programma che gestisce le modalità operative del dispositivo.

All'avvio, il programma mostra un cerchio rosso con la scritta STOP per 2 secondi in alto a destra.

In questa fase, l'utente può:

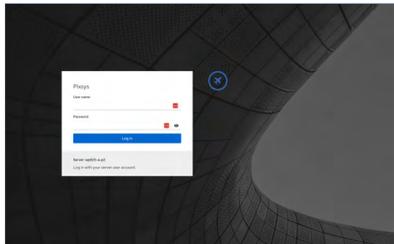

- accedere all'interfaccia di configurazione WPControl (vedere paragrafo 3) tenendo premuto il pulsante STOP per almeno 2 secondi
- avviare la procedura di calibrazione del touch (vedere paragrafo 3.2.f) tenendo premuto una zona qualsiasi al di fuori del pulsante STOP per almeno 2 secondi
- non premere in alcuna zona dello schermo per lasciare avviare il pannello normalmente.

## 3 WPcontrol

### 3.1 Utenti del sistema

SetupUser è l'utente che configura il pannello nel normale funzionamento.

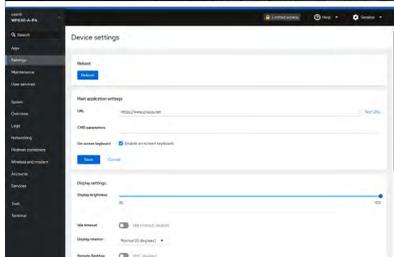

In caso di accesso remoto (FTP, SSH ecc.), SetupUser può operare sui file modificati da WPControl.

All'apertura dell'interfaccia di configurazione, viene visualizzata una richiesta di login: effettuando l'accesso, SetupUser può personalizzare alcuni aspetti del prodotto. Le credenziali di accesso predefinite sono:

Username : user

Password : 123456

La schermata che si apre dopo aver effettuato login è qui rappresentata: mostra un menu sul lato sinistro e una serie di pannelli informativi nella parte centrale.

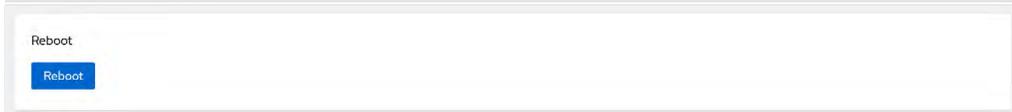

Ogni voce del menu a sinistra viene di seguito descritta.

## 3.2 Sezione Apps

### 3.2.1 Settings

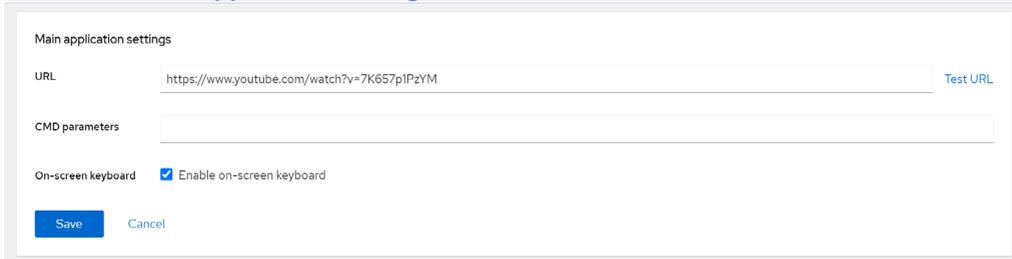

I parametri che l'utente può configurare nella sezione Apps sono i seguenti:

#### 3.2.1.a Reboot

Il pulsante "Reboot" permette il riavvio controllato del dispositivo senza dover togliere e rimettere alimentazione.

#### 3.2.1.b Main Application Settings

Nella sezione "Main Application Settings" è presente un campo di testo in cui va inserito l'URL che verrà aperto dal browser in modalità EndUser.

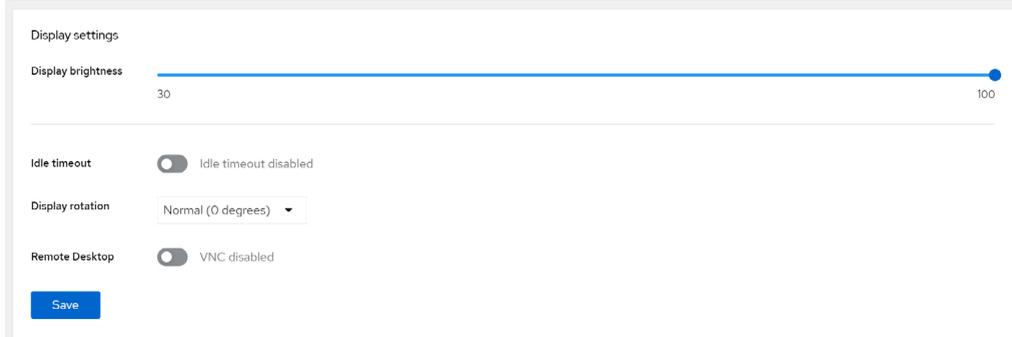

Il pulsante "Test URL" che appare, consente di convalidare l'URL prima di salvarlo (la convalida avviene aprendo la finestra del browser in primo piano). Nel caso in cui il browser web si sia bloccato (cioè il processo è uscito), deve essere riavviato (da systemd).

Il campo “*CMD parameters*” permette di aggiungere parametri specifici di avvio del browser. Si consiglia di non modificare questo campo se non strettamente necessario.

La selezione “*Enable on-screen keyboard*” abilita/disabilita l’apertura di una tastiera virtuale a schermo durante l’uso del browser da parte dell’utente finale, tastiera che viene aperta automaticamente quando ci si posiziona su un campo di tipo testo.

Al termine delle impostazioni premere il bottone Save per il salvataggio delle stesse.

### 3.2.1.c Display settings

Display settings

Display brightness 30 100

Idle timeout  Idle timeout disabled

Display rotation Normal (0 degrees)

Remote Desktop  VNC disabled

Save

In questa sezione è possibile regolare la luminosità del display (default: 100%), l’attivazione/disattivazione della funzione salvaschermo (default: 3600 secondi), la rotazione dello schermo e l’abilitazione/disabilitazione della funzione VNC server sul dispositivo (default: disabilitata).

Al termine delle impostazioni premere il pulsante Save per il salvataggio delle stesse sul dispositivo.

### 3.2.1.d Device reboot settings

Device reboot settings

Press and hold display for 5 seconds at the selected corner to reboot the device.  
Select "None" to turn off the feature.

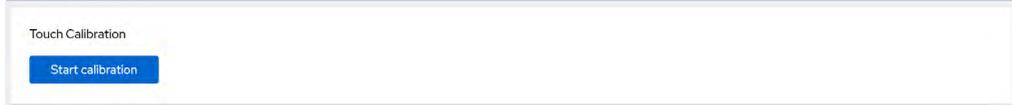

Select corner to reboot device Top Left

Save

Il pannello dispone di una funzione di riavvio che può essere richiamata tenendo premuto una zona specifica dello schermo per almeno 5 secondi.

Questa sezione permette di definire la posizione del punto sullo schermo da tenere premuto o di disattivare la funzione. Al termine delle impostazioni premere il bottone Save per il salvataggio delle stesse sul dispositivo.

### 3.2.1.e Touch calibration

Touch Calibration

Start calibration

Il pulsante “*Start calibration*” avvia la procedura di calibrazione dell’area touch del pannello: seguire le istruzioni a video.

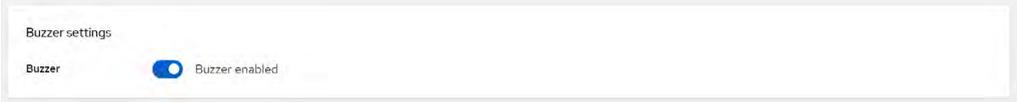

L'utente deve semplicemente premere e rilasciare una dopo l'altra le croci che appaiono in zone diverse dello schermo.

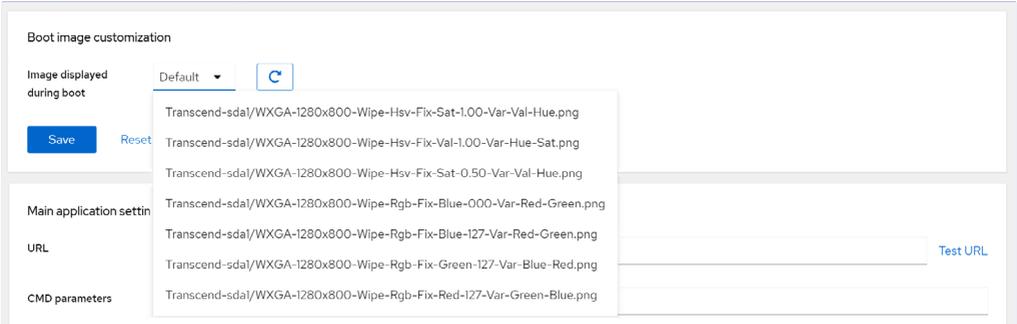

Al termine della sequenza un messaggio informa sull'esito positivo o negativo della procedura.

### 3.2.1.f Buzzer setting

La sezione "Buzzer settings" permette di attivare/disattivare il suono del cicalino all'evento di pressione del touch.

### 3.2.1.g Boot image customization

Inserendo una chiave USB, in questa sezione vengono elencati i files in formato .png presenti nella chiave.

Le immagini possono essere qui selezionate per diventare l'immagine di sfondo della schermata di avvio del dispositivo: l'utente ha quindi modo di personalizzare la schermata iniziale del dispositivo. Premere Save per memorizzare le impostazioni sul dispositivo.

### 3.2.1.h PixsysPortal

Nella sezione "Pixsys Portal" è possibile abilitare il servizio di accesso VPN fornito da Pixsys. Per l'utilizzo del servizio è necessaria la licenza aggiuntiva codice 2400.38.002

Una volta abilitato il servizio sarà possibile accedere alla relativa pagina di configurazione tramite il pulsante "Open Pixsys Portal settings" oppure, da un PC collegato alla stessa rete del pannello, accedendo da Web Browser a <https://indirizzo del pannello:8080>

## 3.2.1.i System information

System information	
Device model	WP820-A-P2
Serial number	P062400000232400001
Distribution name	Pixsys OS
Firmware version	1.4.0
Kernel version	6.0.2
Architecture	aarch64

La sezione “*System information*” riepiloga i dati di sistema della macchina utili in caso di necessità di assistenza tecnica.

## 3.2.2 Maintenance

### 3.2.2.a Configuration backup

Configuration backup

**Prepare USB drive**

The USB drive should be formatted to include only one FAT32 partition.

**Backing up WebPanel configuration**

1. Plug in USB drive to a USB port of the device.
2. Press "Export configuration" button.
3. Current configuration will be saved to a USB drive.

[Export configuration](#) [Export licenses](#) [Export user data](#)

**Restoring WebPanel configuration**

1. Plug in USB drive to a USB port of the device.
2. Press "Restore configuration" button.
3. WebPanel configuration will be restored from a USB drive.

[Restore configuration](#) [Restore licenses](#) [Restore user data](#)

⚠ Warning: This will override current configuration!

La sezione di “*Configuration backup*” permette il backup ed il ripristino alternativo su/da drive USB di configurazione del dispositivo, licenze installate e dati utente. Il backup è utilizzabile per il ripristino o anche per duplicare rapidamente una macchina una volta configurata.

I passaggi da seguire sono descritti a video.

Le operazioni di ripristino vanno a sovrascrivere le informazioni già presenti nel dispositivo, prestare quindi attenzione.

### 3.2.2.b Firmware update

Firmware update

1. Write firmware update image to a USB drive.
2. Plug in USB drive to a USB port of the device.
3. Press "Update firmware" button and confirm.
4. The device will reboot and start the update procedure.

[Update](#)

La sezione “*Firmware update*” permette l’avvio della procedura di aggiornamento del firmware del dispositivo previo inserimento della memoria USB contenente l’aggiornamento nella porta apposita. Per maggiori info sulla procedura di aggiornamento contattare l’assistenza tecnica Pixsys scrivendo a support@pixsys.net

### 3.2.2.c Factory reset

#### Factory reset

1. Select the "Reset" option and confirm the action.
2. The device will power down and commence the reset process.

Reset

⚠ Warning: Factory reset will erase all user data and restore default settings!

In questa sezione l'utente ha la possibilità di ripristinare il dispositivo alle impostazioni di fabbrica premendo sul bottone nell'apposita sezione. Questa operazione va a cancellare e sovrascrivere tutte le informazioni già presenti nel dispositivo e lo riporta alla condizione di fabbrica.

Al riavvio automatico del dispositivo, partirà la procedura di calibrazione del touch (per maggiori informazioni su tale procedura vedere inoltre il paragrafo 3.2.f)

**NB:** se nel pannello sono presenti dati dell'utente / Progetti Codesys / Licenze PixsysPortal che non si intende perdere, prima di procedere al Reset effettuare i backup necessari come descritto in "3.2.2.a Configuration backup".

### 3.2.2.d Reboot

#### Reboot

Reboot

Il pulsante "Reboot" permette il riavvio controllato del dispositivo senza dover togliere e rimettere alimentazione.

### 3.2.2.e System information

#### System information

Device model	WP820-A-P2
Serial number	P062400000232400001
Distribution name	Pixsys OS
Firmware version	1.4.0
Kernel version	6.0.2
Architecture	aaarch64

La sezione "System information" riepiloga i dati di sistema della macchina utili in caso di necessità di assistenza tecnica.

## 3.2.3 User services

#### User services

User services status

Add new service

No services

Cliccando il pulsante "Add new service" è possibile configurare l'esecuzione, all'avvio del sistema operativo, di servizi realizzati dall'utente, indicandone il percorso alla voce "Service name" e gli eventuali parametri di avvio alla voce "Command line". Il pulsante "User services status" permette di richiedere e visualizzare lo stato degli eventuali servizi configurati in precedenza.

## Add new systemd service ✕

*Enter a service name and a command to execute.  
Service will be automatically enabled and started.  
Service name can contain alphanumeric characters, dashes and  
underscores.*

Service name \*

Command line \*

Add

Cancel

## 3.3 Sezione System

### 3.3.1 Overview

Web console is running in limited access mode. [Turn on administrative access.](#)

WP630-A-P4 (wp630-a-p4) running Pixsys OS 1.8.0

#### Health

⚠️ 1 failed login attempt  
Jun 10, 05:22 PM from ::ffff:192.168.1.198 on web console  
Last successful login: Jun 10, 05:22 PM  
[View login history](#)

#### Usage

CPU  1% of 8 CPUs  
Memory  0.88 / 3.8 GiB  
[View metrics and history](#)

#### System information

Machine ID 4c16076a336644eab40837f4e0ba44d5  
Uptime 12 days  
[View hardware details](#)

#### Configuration

Hostname WP630-A-P4 (wp630-a-p4) [edit](#)  
System time [Jun 11, 2025, 9:36 AM](#) ⓘ  
Domain [Join domain](#)  
Performance profile none  
Secure shell keys [Show fingerprints](#)

La sezione Overview permette di vedere informazioni generiche relative allo stato del sistema, come tempo di accensione (valore “Uptime”), carico CPU e memoria RAM (sezione “Usage”), orologio e nome del prodotto (sezione “Configuration”).

### Change system time

Time zone

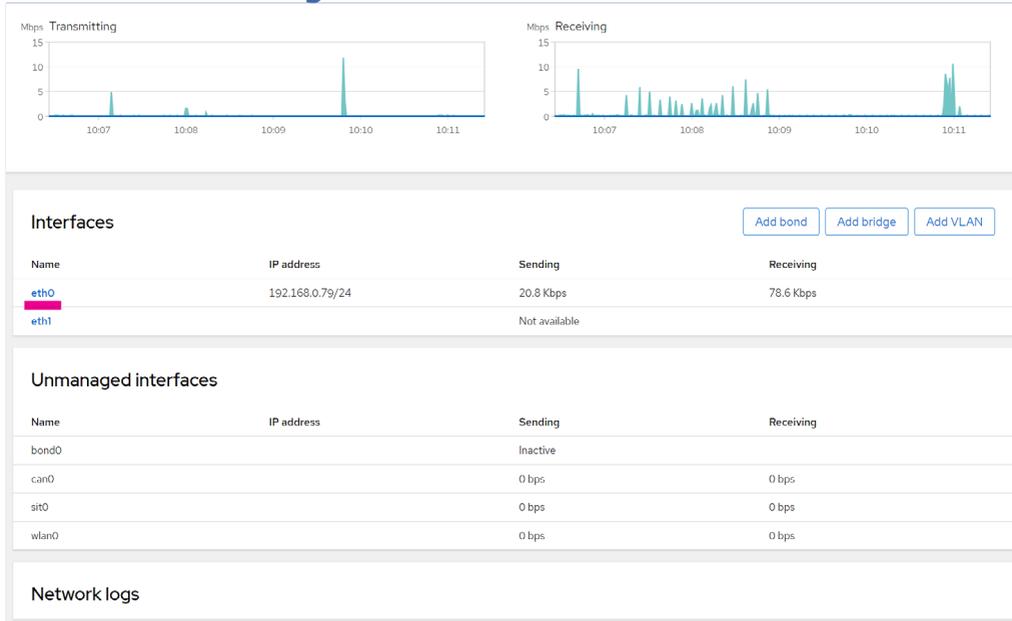

Set time

[Change](#) [Cancel](#)

- Manually
- Automatically using NTP
- Automatically using specific NTP servers

Premendo il campo “System time” è possibile configurare l’orologio di sistema in modo manuale oppure automaticamente dal server NTP (Google) oppure automaticamente da un server specifico, indicando il suo indirizzo IP.

## 3.3.2 Networking

The dashboard displays two line graphs at the top: 'Transmitting' (Mbps) and 'Receiving' (Mbps), both showing data from 10:07 to 10:11. Below the graphs is a table titled 'Interfaces' with buttons for 'Add bond', 'Add bridge', and 'Add VLAN'. The table lists 'eth0' with IP 192.168.0.79/24, sending 20.8 Kbps and receiving 78.6 Kbps, and 'eth1' which is not available. Below this is a table for 'Unmanaged interfaces' listing 'bond0', 'can0', 'sit0', and 'wlan0' with their respective sending and receiving rates.

Name	IP address	Sending	Receiving
eth0	192.168.0.79/24	20.8 Kbps	78.6 Kbps
eth1		Not available	

Name	IP address	Sending	Receiving
bond0		Inactive	
can0		0 bps	0 bps
sit0		0 bps	0 bps
wlan0		0 bps	0 bps

La voce di menu “Networking” mostra informazioni in tempo reale relativamente alla connessione attiva e, cliccando sul nome della scheda di rete, permette di andare a configurare i parametri di connessione

The configuration screen for 'eth0' shows the MAC address 'rk\_gmac-dwmac 7C:6C:39:05:99:4E' and a toggle switch. The status is '192.168.0.79/24, fe80:0:0:c1d2:80e8:2a6a:33a/64'. The carrier is '100 Mbps'. The 'General' section has 'Connect automatically' checked. IPv4 and IPv6 are set to 'Automatic' with edit links. MTU is also set to 'Automatic' with an edit link.

eth0 rk\_gmac-dwmac 7C:6C:39:05:99:4E

Status 192.168.0.79/24, fe80:0:0:c1d2:80e8:2a6a:33a/64

Carrier 100 Mbps

General  Connect automatically

IPv4 Automatic [edit](#)

IPv6 Automatic [edit](#)

MTU Automatic [edit](#)

Nella schermata che si apre, l'utente può verificare lo stato della connessione, abilitando e disabilitando la scheda di rete e può vedere e configurare l'IP del sistema e le modalità di assegnazione dello stesso.

## 3.3.3 Podman containers

Container	Owner	CPU	Memory	State
> nodered <small>docker.io/nodered/node-red:latest</small>	user: user	0.00%	0.0570 / 2.08 GB	Running

La voce di menu “Podman Containers” permette il monitoraggio e la gestione dei contenitori in ambiente Docker. Per la creazione di un container vedere documentazione specifica sul sito Pixsys.

## 3.3.4 Wireless and modem

**Wireless configuration**

Active connection:

Rescan

IN-USE	BSSID	SSID	MODE	CHAN	RATE	SIGNAL	BARS	SECURITY
--------	-------	------	------	------	------	--------	------	----------

**Wifi client**

SSID:

Password:

Activate Reset

La sezione “Wireless configuration”, premendo il pulsante “Rescan”, mostra le reti WiFi disponibili e i parametri (SSID e Password) da inserire per il collegamento alla rete WiFi selezionata.

La sezione “Wifi client” permette di configurare il dispositivo per agire come hotspot ed indicare quindi la password da fornire per potersi collegare.

Il dispositivo può essere dotato di una penna USB-Wifi (codice Pixsys 2400.10.021) che permette la connessione a reti wireless 802.11 abgn/ac.

**NB:** l'utilizzo di penne USB-Wifi non fornite da Pixsys non garantisce il funzionamento della connettività wireless.

## 3.3.5 Accounts

> Groups wheel:0 sudo:0 root:1 50 more...

**Accounts**

Search for name, grou...

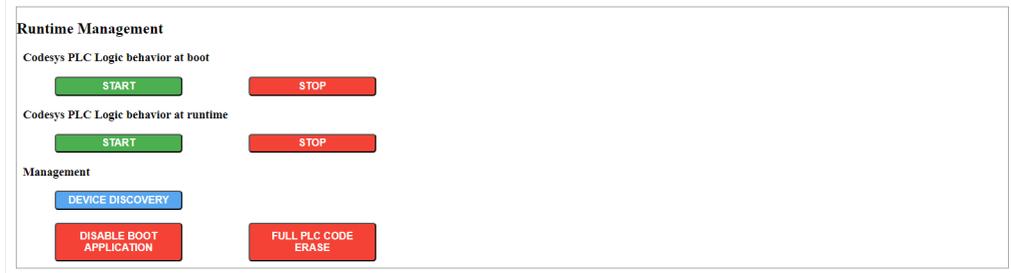

Username	Full name	ID	Last active	Group
user		1000	Never logged in	setup-user wayland
pixsys		1001	Never logged in	pixsys-user
root	root	0	Never logged in	admin (root)

La voce di menu Accounts permette, agli utenti autorizzati, di gestire la strutturazione di gruppi di utenti e relative autorizzazioni.

# 3.4 Sezione Tools

## 3.4.1 Codesys

### 3.4.1.a Runtime management

La sezione *“Runtime Management”* permette il controllo del runtime Codesys installato nel dispositivo.

- Codesys PLC Logic behavior at boot: le scelte START/STOP permettono di scegliere se il runtime Codesys deve essere avviato automaticamente oppure no all'avvio del dispositivo (default: START).
- Codesys PLC Logic behavior at runtime: le scelte START/STOP permettono di avviare e fermare il runtime durante il normale funzionamento senza modificare il comportamento al boot. (default: START).
- Management: *“DEVICE DISCOVERY”* permette di far eseguire alcuni beep a cambi di luminosità al pannello per poterlo identificare facilmente all'interno di una installazione con più dispositivi. *“DISABLE BOOT APPLICATION”* evita che l'applicazione di BOOT (progetto) venga caricato all'avvio del runtime Codesys, permettendo di collegarsi al dispositivo tramite l'ambiente di sviluppo in caso di eccezioni bloccanti scatenate dal codice scaricato. *“FULL PLC CODE ERASE”* elimina completamente il progetto e relativi file dal dispositivo.

### 3.4.1.b Runtime status

La sezione *“Runtime Status”*, attraverso il pulsante *“READ STATUS”*, verifica lo stato del servizio Codesys Control.

La voce *“active”* identifica che il servizio è in esecuzione regolarmente.

Nel caso lo stato sia diverso da *“active”* si consiglia di contattare l'assistenza tecnica Pixsys.

### 3.4.1.c Backup password

#### Backup password

Create a password to encrypt your backup.

With the password enabled only protected backups can be extracted to the PLC.

To delete the password, delete the password field and press save.

**Attention! If the password is deleted, the backups can no longer be restored.**

Encrypt backups with password:  

SAVE

Questa sezione permette di applicare una password in fase di creazione del backup. In questo modo, per estrarre tale backup su un nuovo dispositivo, questo dovrà avere la password corretta (che dovrà essere inserita nello stesso campo).

### 3.4.1.d Backup to/from USB device

#### Backup to/from USB device.

If there isn't FAT32 USB device connected to the PLC the backup will be generated ore restored from /tmp

BACKUP CREATE

BACKUP RESTORE

La sezione permette di creare o recuperare il backup di un progetto Codesys presente nel dispositivo, per poterlo installare in nuovi dispositivi, velocizzando la produzione in serie di macchine.

**NB:** Nel caso non sia stata collegata una penna USB al dispositivo, l'archivio contenente il backup sarà creato nella directory "/tmp", accessibile facilmente via FTP.

### 3.4.1.e Create a debug log on USB Key

#### Create a debug log on USB Key

Creation of a log file to provide to technical support for assistance.

1. Connect a FAT32 formatted USB stick to the PLC.
2. Press the  button.
3. Wait for the 'success' message to appear.
4. Remove the USB stick from the PLC.
5. Send the file with the .tar.gz extension present inside the flash drive to technical support.

Questa funzionalità permette di creare un archivio contenente tutti i log dei servizi in esecuzione nel dispositivo (compreso il runtime Codesys), utile per l'invio al Supporto Tecnico Pixsys qualora sia richiesta assistenza.

## 3.4.2 Terminal

Da questa finestra si accede ad una sessione SSH per richiamare manualmente comandi di sistema.

Read carefully the safety guidelines and programming instructions contained in this manual before using/connecting the device.

Prima di utilizzare il dispositivo leggere con attenzione le informazioni di sicurezza e settaggio contenute in questo manuale.
